

PDF Inspector

See exactly what your PDF is made of.

jexter · SugarcubePDF — PDF → OCD → PDF · EPUB · SVG

This is a real PDF. Open it in PDF Inspector to look inside — its pages, its structure, its text, and its fonts. The page you are reading mixes embedded and non-embedded fonts, vector drawings, an axial gradient, and a small image, so every panel of the inspector has something to show.

Page

A pixel-exact raster of every page, rendered by Apache PDFBox. Pan, zoom, and switch the render source to compare PDFBox against the OCD model.

Structure

Walk the raw COS object tree — dictionaries, streams and indirect references: the true skeleton of the document beneath the page you see.

Text

The extractable text layer via PDFTextStripper — exactly what a copy-and-paste would yield, so you can tell real text from outlined shapes.

Three ways to render — one click apart

PDFBox

OCD model

OCD reread

Toggle the source while page and zoom stay fixed: a difference between PDFBox and OCD points at conversion; OCD vs. reread points at serialization.

Inside this page

- **Fonts** — DejaVu Sans & DejaVu Sans Bold are embedded; Helvetica is a base-14 font, not embedded — the Fonts table marks each.
- **Graphics** — An axial gradient (a PDF shading) plus the magnifier and the three glyphs above, all drawn as vector paths.
- **Image** — One embedded RGB image — the small swatch on the right — appears as an XObject in the Structure tree.
- **Text** — Every word here is a real text layer, so the Text tab and copy-paste return it verbatim.
